5/10RX Syslog Configuration

- 2018-02-15 - 5/10RX Routers

Syslog is a 5/10RX feature that allows the configuration of a remote server (Syslog Server) to receive 10RX events that are normally only recorded in a local file. This allows the system administrator to conserve space in the 10RX file system by reducing the requirement to keep events locally for a long period of time.
