

DX940e - Router configuration for a SCADA application over Verizon MPLS

John M - 2019-12-23 - DX/10XTS Routers

Overview

This example steps through the various configuration screens to setup a SCADA application using a DX940e's at both the headend and remote sites using Verizon MPLS service offering.

For redundancy, each Control center has simultaneous connections to each remote serial attached RTU and employs L3 VPN tunnels for security.

Configuration Information used in this example:

Accessing the DX940e Configuration system

The initial access to DX940e configuration system can be accessed by direct connection to the units console connection, or via an IP based connection using Telnet or SSH. Access to the WEB interface can be achieved using a WEB browser. If this is a new unit the factory default IP address is 192.168.1.2. Please also note that all ports on a factory default setting will be disabled with the exception of the **highest** Ethernet port number. So for a DX940e connect your PC initially to E6.

If you can't access the DX940e via the Ethernet port, because its address is unknown, then the IP address can be reset via the Console port BOOT application. Using a PC Terminal application such as Putty or TeraTerm and connect to the dedicated CONSOLE port (38,400 bps, no parity, 8 data bits and 1 stop bit) using a standard DB9 cross over cable (supplied with the equipment) and holding down the SPACE bar after a DX940e power cycle.

GarrettCom, Inc.

MNS-DX ROM version 3.1.7 (Y12) 200/128

***** Hold down SPACE to stop boot process *****

Starting boot menu...

Boot Menu

1: View System Information

2: Assign System IP Address

3: Install Initial Software Image from FTP Server

4: Install Initial Software Image via TFTP

5: Install Initial Software Image via XMODEM

6: Load Temporary Image from FTP Server

7: Load Temporary Image via TFTP

8: Load Temporary Image via XMODEM

9: Restore System to Factory Defaults

b: Boot

MNS-DX>

Simply use Option 2: to define the initial IP address, then Option b: to boot.

You could also use option "9" to reset all configurations to factory default and the initial IP address of the DX940e would be 192.168.1.2.

Once IP addresses have been assigned one can access to the configuration system, this section covers WEB access.

Once the address is defined then launch a HTTPS: session to the address that was defined. For this example we are using 192.168.2.2
Mask 255.255.255.0.

Please note that only SECURE access methods are enabled by default, so we need to use HTTPS for WEB access, SSH or Direct console for CLI access.

Default passwords for ADMIN access is “manager/manager”

Initial Virtual Front Panel Web screen showing various system level information including software version etc.

Configurations for DX940e A (Control Center)

Overview of configurations steps

1. Naming the Dx940e
2. Ethernet ports
3. Un bridging an Ethernet Port
4. IP address assignments
5. BGP routing

By default all Ethernet ports are ADMIN DISBALED except for port 6. So we need to enable the ports we want to use, in this case E1.

Also by default all Ethernet ports are bridged and only holds one IP address. In this case we are routing between the Control center and Verizon MPLS network with 2 different subnets, so we need un-bridge at least one port to form 2 subnets.

So here we have un-bridged E1 forming a second sub-net

IP addresses

We had previously set the IP address of the DX940e to 192.168.2.2/24 but it can be changed from within this sub-menu.

So with an Ethernet port unbridged we now have two IP subnets, so fill in E1 to 192.168.3.3

Routing : IP Addresses

Interface	DHCP?	Address	Subnet Mask	Remote Address	System	Status
Default	No	192.168.2.2	255.255.255.0		<input checked="" type="radio"/>	Up
E1	No	192.168.3.3	255.255.255.0		<input type="radio"/>	Up
CELL1	No				<input type="radio"/>	Down

[Other Options](#)

BGP Routing

When using a Verizon carrier service like MPLS this usually requires BGP as the routing protocol of preference.

Starting with Global Settings we enable to feature, assign the AS number, and the Router ID which is simply the IP address of the Ethernet port connecting to the Verizon MPLS service.

Routing : BGP : Global Settings

BGP Mode:	Enabled
AS Number:	20
Router ID:	192.168.3.3
eBGP Admin Distance:	20
iBGP Admin Distance:	200
Include Ext OSPF:	Disabled
Event Level:	High

Next BGP Peer Settings, IP addresses for each end of the connection and associated AS numbers. Here I left the Profile as “default” but we will make changes to that profile next.

Routing : BGP : Peer Settings

Add Peer

BGP Name	Peer IP Address	Local IP Address	Peer AS	Local AS	Hold Timer (sec)	Profile	Input Filter	Output Filter	MD5 Password
bgp-1	0.0.0.0	0.0.0.0	1	1	40	Default	NONE	NONE	

Existing Peers

BGP Name	Peer IP Address	Local IP Address	Peer AS	Local AS	Hold Timer (sec)	Profile	Input Filter	Output Filter	MD5 Password	Delete
bgp-1	192.168.3.2	192.168.3.3	10	20	40	Default	NONE	NONE		<input type="checkbox"/>

Modify the “default” profile next, here we have selected “Redist Static and BGP”, this just means we will share information of local IP addresses into the BGP protocol and also learnt IP addresses through BGP placed into the routing table.

Routing : BGP : Profiles

Add New Profile

Profile Name	Default Router	Redist Static	Redist RIP	Redist OSPF	Redist BGP	Weight	Private AS	Local Pref	TCP Passive
New Profile	No	No	No	No	No	100	No	100	No

Existing Profiles

Profile Name	Default Router	Redist Static	Redist RIP	Redist OSPF	Redist BGP	Weight	Private AS	Local Pref	TCP Passive	Delete
Default	No	Yes	No	No	Yes	100	Yes	100	No	<input type="checkbox"/>

If the unit is connected to the Verizon circuit we should see status information similar to this

Routing : BGP : Status

Neighbor	Version	AS #	BGP State	Nets Rcvd	Pkts Sent	Pkts Rcvd	TCP/MD5 Session	Reset
192.168.3.2	4	10	Established	2	16982	17339	No	None

And the RIB table populated with learnt IP addresses.

Routing : BGP : RIB

Prefix	Bits	Source Peer #	Source AS#	Number Hops	Weight	Origin	Local Pref	eBGP/iBGP
10.10.10.0	24	192.168.3.2	10	1	100	2	0	e
192.168.4.0	24	192.168.3.2	40	2	100	1	0	e

Finally a look at the full IP routing table to check we have full connectivity of the network

Routing : Table

Route Destination	Route Mask	Next Hop	Administrative Distance	Metric	Age	Type
10.10.10.0	255.255.255.0	192.168.3.2	1	0		VPN
127.0.0.1	255.255.255.255	127.0.0.1	0	0		
192.168.2.0	255.255.255.0	192.168.2.2	0	0		Local
192.168.2.2	255.255.255.255	192.168.2.2	0	0		
192.168.3.0	255.255.255.0	192.168.3.3	0	0		Local
192.168.3.3	255.255.255.255	192.168.3.3	0	0		
192.168.4.0	255.255.255.0	192.168.3.2	20	0	177072	BGP

VPN Setup

Since we are using a Public Verizon MPLS service where it might be possible that the SCADA information could be eavesdropped we use a VPN tunnel to provide both authentication and encryption services for the

SCADA traffic.

Starting with Global Settings, turn on “send initial contact”

Next we build a new profile and selected the version of the IPsec VPN and the encryption settings for the Authentication and Data Transfer phases.

Here I selected the most secure settings, IPsec version IKEV2, AES256 encryption strength and both IKE and ESP Hash to SHA256.

Now for the actual authentication “shared secret”, we can use Pre-Shared Key or you may prefer to build your own private certificates, not covered

here. The Pre-shared Key method is just a string of characters, like a password, that is used during authentication of the 2 VPN peers. In this example it was set to "howardsway". As you can see the string is not displayed for security purposes but it is set.

Security : VPN : Authentication

Add Method

Name	Type	Preshared Key	Preshared Key Verify	Local Certificate
<input type="text"/>	PSK	<input type="text"/>	<input type="text"/>	None

Existing Methods

Name	Type	Preshared Key	Preshared Key Verify	Local Certificate	Delete
Default	PSK	<input type="text"/>	<input type="text"/>	None	<input type="checkbox"/>
coned	PSK	<input type="text"/>	<input type="text"/>	None	<input type="checkbox"/>

With all that set we can finally define the tunnel end points , so we want the tunnel to exist throughout the Verizon network, so in this example we want any traffic between 192.168.2.x and 10.10.10.x , ie the Control Station network and remote RTU network and be protected throughout the "public" network and using the new profile and authentication methods. Note the Destination gateway is the IP address of the substation DX940e WAN port and we also selected that the VPN be up and available at all times.

Security : VPN : Tunnels

Add Tunnel

Source Address	Source Mask	Destination Address	Destination Mask	Destination Gateway	Profile	Authentication	Protocol	Always Up
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	Default	Default	any	No

Existing VPN Tunnels

ID	Source Address	Source Mask	Destination Address	Destination Mask	Destination Gateway	Profile	Authentication	Protocol	Always Up	Delete
1	192.168.2.0	255.255.255.0	10.10.10.0	255.255.255.0	10.10.10.2	coned	coned	any	Yes	<input type="checkbox"/>

Successful VPN connection can be verified

Security : VPN : Status

Tunnel Statistics

ID	Source Address	Destination Address	Next Hop	Status	Time Remaining (secs)	Restart
1	192.168.2.0	10.10.10.0	10.10.10.2	VPN up	2555	<input type="checkbox"/>

Security : VPN : Details

Source Address	Destination Address	Inbound SPI	Outbound SPI	Remaining Time (secs)	Inbound Packets	Outbound Packets
192.168.2.0	10.10.10.0	FD4FB110	84276FB2	2530	4	4

Saving Configurations

Please make sure you SAVE the configurations we have made by hitting the "SAVE" ICON at the bottom right of the WEB screen, the button is highlighted when there are configurations that have not been saved.

Configurations for DX940e C (Substation Locations)

Overview of configurations steps

1. Naming the Dx940e
2. Ethernet ports
3. T1 WAN Port
4. Frame Relay
5. IP address assignments
6. BGP routing
7. VPN setup
8. Serial Ports
9. Terminal Server
10. Saving configurations

Naming the DX940e

The Administration menu gives a few options for naming/location and contact..

A screenshot of the 'Administration : System : Information' configuration page. The page has a light gray background and a central white box with a black border containing the configuration fields. At the bottom of the page are three buttons: 'Refresh', 'Reset Settings', and 'Apply Settings'.

Administration : System : Information	
System Name:	<input type="text" value="DX940e C"/>
System Location:	<input type="text" value="Substation Locations"/>
System Contact:	<input type="text" value="System Contact"/>
System Mode:	<input type="text" value="Normal"/> ▼
System Prompt:	<input type="text" value="MagnumDX"/>
TCP KeepAlive:	<input type="text" value="15"/>
System Description:	DX940e v1.0.2 (Y2)
Serial Number:	680100046
Licenses:	SECURE+ADVAR
Upgrade State:	UPGRADED
IP Address:	192.168.4.2
MAC Address:	00:20:61:1F:0F:90
Free Space (KB):	51431
Uptime:	2 days, 23 hours, 59 minutes

Ethernet Ports

There is no requirement for ethernet ports for this application.

T1 WAN Port

- WAN
- Settings
- Status
- Statistics
- Frame Relay
- FR Statistics
- DLCI Settings
- DLCI Status
- Switch Settings
- EEK Settings
- EEK Status

Physical port settings for the T1 interface, set timeslot bandwidth to 64k, Clock Received and Admin enable, all other values leave as defaults

WAN : Port Settings

Port ID	Port Name	Timeslot Bandwidth	Clock	Admin Status	Mode	Time Slots	Frame Types	Line Codes	Line Build Out
W1	WAN-01	64k	Received	Enabled	T1	1-24	ESF (T1)	B8ZS (T1)	0to133

If this is correct then looking at T1 status should look like this.

WAN : Port Status

Port ID	Line State	LMI State	Oper State
W1	OK	Up	Up

Then we select if we want to employ the LMI management channel, unfortunately there are 3 variants, but Verizon uses CISCO and so the LMI type should be the original LMI version, and select User role.

WAN : Frame Relay

Port ID	Fragmentation Size	LMI Type	LMI Mode	TxQ Mode	Token Q Pct
W1	0	LMI	User	8421	70

Last step here is to define a DLCI for the IP traffic application, here with picked DLCI 100, but the actual DLCI would have been provided by Verizon. Set the application for this DLCI to IP=YES and Layer3-IP.

WAN : DLCI Settings

Add DLCI

Port ID	DLCI	CIR	IP	EEK	TYPE
W1			Yes	None	Layer3-IP

Existing DLCIs

Port ID	DLCI	CIR	IP	EEK	TYPE	Delete
W1	100		Yes	None	Layer3-IP	<input type="checkbox"/>

[Vendor Specific Details](#)

The status the DLCI can be seen here.

WAN : DLCI Status

Port ID	DLCI	State	Rx Packets	Rx Octets	Tx Packets	Tx Octets	Rx Drops	Tx Drops
W1	100	Active	64005	4461561	72364	5527556	0	0

IP addresses

We had previously set the IP address of the DX940e to 192.168.2.4/24 but it can be changed from within this sub-menu. We only will use port 6 for web interface configuration.

So with simply add in a new IP address for the WAN port 10.10.10.2/24

Routing : IP Addresses

Interface	DHCP?	Address	Subnet Mask	Remote Address	System	Status
Default	No	192.168.4.2	255.255.255.0		<input checked="" type="radio"/>	Up
W1-DLCI 100	No	10.10.10.2	255.255.255.0		<input type="radio"/>	Up
CELL1	No				<input type="radio"/>	Down

[Other Options](#)

BGP Routing

When using a Verizon carrier service like MPLS this usually requires BGP as the routing protocol of preference.

Starting with Global Settings we enable to feature, assign the AS number, and the Router ID which is simply the IP address of the Ethernet port connecting to the Verizon MPLS service.

Routing : BGP : Global Settings

BGP Mode:	Enabled
AS Number:	40
Router ID:	10.10.10.2
eBGP Admin Distance:	20
iBGP Admin Distance:	200
Include Ext OSPF:	Disabled
Event Level	High

Next BGP Peer Settings, IP addresses for each end of the connection and associated AS numbers. Here I left the Profile as “default” but we will make changes to that profile next.

Routing : BGP : Peer Settings

Add Peer

BGP Name	Peer IP Address	Local IP Address	Peer AS	Local AS	Hold Timer (sec)	Profile	Input Filter	Output Filter	MD5 Password
bgp-1	0.0.0.0	0.0.0.0	1	1	40	Default	NONE	NONE	

Existing Peers

BGP Name	Peer IP Address	Local IP Address	Peer AS	Local AS	Hold Timer (sec)	Profile	Input Filter	Output Filter	MD5 Password	Delete
FR-link	10.10.10.1	10.10.10.2	30	40	40	Default	NONE	NONE		<input type="checkbox"/>

Modify the "default" profile next, here we have selected "Redist Static and BGP", this just means we will share information of local IP addresses into the BGP protocol and also learnt IP addresses through BGP placed into the routing table.

Routing : BGP : Profiles

Add New Profile

Profile Name	Default Router	Redist Static	Redist RIP	Redist OSPF	Redist BGP	Weight	Private AS	Local Pref	TCP Passive
New Profile	No	No	No	No	No	100	No	100	No

Existing Profiles

Profile Name	Default Router	Redist Static	Redist RIP	Redist OSPF	Redist BGP	Weight	Private AS	Local Pref	TCP Passive	Delete
Default	No	Yes	No	No	Yes	100	Yes	100	No	<input type="checkbox"/>

If the unit is connected to the Verizon circuit we should see status information similar to this

Routing : BGP : Status

Neighbor	Version	AS #	BGP State	Nets Rcvd	Pkts Sent	Pkts Rcvd	TCP/MD5 Session	Reset
10.10.10.1	4	30	Established	2	125	127	No	None

And the RIB table populated with learnt IP addresses.

Routing : BGP : RIB

Prefix	Bits	Source Peer #	Source AS#	Number Hops	Weight	Origin	Local Pref	eBGP/iBGP
192.168.3.0	24	10.10.10.1	30	1	100	2	0	e
192.168.2.0	24	10.10.10.1	20	2	100	1	0	e

Finally a look at the full IP routing table to check we have full connectivity of the network

Routing : Table

Route Destination	Route Mask	Next Hop	Administrative Distance	Metric	Age	Type
10.10.10.0	255.255.255.0	10.10.10.2	0	0		Local
10.10.10.2	255.255.255.255	10.10.10.2	0	0		
127.0.0.1	255.255.255.255	127.0.0.1	0	0		
192.168.2.0	255.255.255.0	10.10.10.1	1	0		VPN
192.168.3.0	255.255.255.0	10.10.10.1	20	0	5658	BGP
192.168.4.0	255.255.255.0	192.168.4.2	0	0		Local
192.168.4.2	255.255.255.255	192.168.4.2	0	0		

VPN Setup

Since we are using a Public Verizon MPLS service where it might be possible that the SCADA information could be eavesdropped we use a VPN tunnel to provide both authentication and encryption services for the SCADA traffic.

Starting with Global Settings, turn on "send initial contact"

Security : VPN : Global Settings

Send Initial Contact:

Automatic VPN Routes:

Administrative Distance:

Next we build a new profile and selected the version of the IPsec VPN and the encryption settings for the Authentication and Data Transfer phases.

Here I selected the most secure settings, IPsec version IKEV2, AES256 encryption strength and both IKE and ESP Hash to SHA256.

Security : VPN : Profiles

Add Profile

Name	IKE Version	NAT Enabled	IKE Encryption	IKE Hash	IKE Lifetime (secs)	ESP Encryption	ESP Hash	ESP Lifetime (secs)	DH Group	DPD Poll Time
<input type="text"/>	<input type="text" value="IKEV1"/>	<input type="text" value="NO"/>	<input type="text" value="3DES"/>	<input type="text" value="SHA"/>	<input type="text" value="28800"/>	<input type="text" value="3DES"/>	<input type="text" value="SHA"/>	<input type="text" value="3600"/>	<input type="text" value="2"/>	<input type="text" value="30"/>

Existing Profiles

Name	IKE Version	NAT Enabled	IKE Encryption	IKE Hash	IKE Lifetime (secs)	ESP Encryption	ESP Hash	ESP Lifetime (secs)	DH Group	DPD Poll Time	Delete
Default	<input type="text" value="IKEV1"/>	<input type="text" value="NO"/>	<input type="text" value="3DES"/>	<input type="text" value="SHA"/>	<input type="text" value="28800"/>	<input type="text" value="3DES"/>	<input type="text" value="SHA"/>	<input type="text" value="3600"/>	<input type="text" value="2"/>	<input type="text" value="30"/>	<input type="checkbox"/>
coned	<input type="text" value="IKEV2"/>	<input type="text" value="NO"/>	<input type="text" value="AES256"/>	<input type="text" value="SHA256"/>	<input type="text" value="28800"/>	<input type="text" value="AES256"/>	<input type="text" value="SHA256"/>	<input type="text" value="3600"/>	<input type="text" value="2"/>	<input type="text" value="30"/>	<input type="checkbox"/>

Now for the actual authentication “shared secret”, we can use Pre-Shared Key or you may prefer to build your own private certificates, not covered here. The Pre-shared Key method is just a string of characters, like a password, that is used during authentication of the 2 VPN peers. In this example it was set to “howardsway”. As you can see the string is not displayed for security purposes but it is set.

Security : VPN : Authentication

Add Method

Name	Type	Preshared Key	Preshared Key Verify	Local Certificate
<input type="text"/>	<input type="text" value="PSK"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="None"/>

Existing Methods

Name	Type	Preshared Key	Preshared Key Verify	Local Certificate	Delete
Default	<input type="text" value="PSK"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="None"/>	<input type="checkbox"/>
coned	<input type="text" value="PSK"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="None"/>	<input type="checkbox"/>

With all that set we can finally define the tunnel end points, so we want the tunnel to exist throughout the Verizon network, so in this example we want any traffic between 192.168.2.x and 10.10.10.x , ie the Control Station network and remote RTU network and be protected throughout the “public” network and using the new profile and authentication methods. Note the Destination gateway is the IP address of the substation DX940e WAN port and we also selected that the VPN be up and available at all times.

Security : VPN : Tunnels

Add Tunnel

Source Address	Source Mask	Destination Address	Destination Mask	Destination Gateway	Profile	Authentication	Protocol	Always Up
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	Default	Default	any	No

Existing VPN Tunnels

ID	Source Address	Source Mask	Destination Address	Destination Mask	Destination Gateway	Profile	Authentication	Protocol	Always Up	Delete
1	10.10.10.0	255.255.255.0	192.168.2.0	255.255.255.0	192.168.3.3	coned	coned	any	No	<input type="checkbox"/>

Successful VPN connection can be verified

Security : VPN : Status

Tunnel Statistics

ID	Source Address	Destination Address	Next Hop	Status	Time Remaining (secs)	Restart
1	10.10.10.0	192.168.2.0	192.168.3.3	VPN up	2156	<input type="checkbox"/>

Security : VPN : Details

Source Address	Destination Address	Inbound SPI	Outbound SPI	Remaining Time (secs)	Inbound Packets	Outbound Packets
10.10.10.0	192.168.2.0	3C0C6653	4C4AC1DF	2127	11	13

Serial Ports

- Serial
- Ports
 - Profiles
 - Settings
 - Status
 - Statistics

All serial ports in the default configuration are disabled, so we need to enable the port, and perhaps name it.

Serial : Ports : Settings

Port ID	Port Name	Profile	Admin Status
S1	RTU	Default	Enabled
S2	Serial-02	Default	Disabled
S3	Serial-03	Default	Disabled
S4	Serial-04	Default	Disabled

Next we setup a profile that matches the RTU, Baud, Parity, Stops bits etc. We also need to set "Ignore DSS" to YES, and adjust the Pkt time to 20 versus 200.

Serial : Ports : Profiles

Add New Profile

Profile Name	Interface Standard	Speed	Data Bits	Stop Bits	Parity	Ignore DSS	Flow Control	Pkt Char	Pkt Time (msecs)	Max Pkt Size (bytes)	T/A Time (msecs)
New Profile	RS232	9600	8	1	None	No	None	None	200	1024	0

Existing Profiles

Profile Name	Interface Standard	Speed	Data Bits	Stop Bits	Parity	Ignore DSS	Flow Control	Pkt Char	Pkt Time (msecs)	Max Pkt Size (bytes)	T/A Time (msecs)	Delete
Default	RS232	9600	8	1	None	Yes	None	None	20	1024	0	<input type="checkbox"/>

We can check the status, the Ignore DSS parameter enables the port rather than needing additional signals like DTR from the RTU.

Serial : Ports : Status

Port ID	DCD	CTS	DSR	Oper State
S1	Off	Off	Off	Up
S2	Off	Off	Off	Disabled
S3	Off	Off	Off	Disabled
S4	Off	Off	Off	Disabled

Terminal Server

The terminal server acts as the transition for the IP TCP session carrying DNP3 traffic and passing just the payload to the serial port.

The channel settings shows call direction inbound, allows for any IP to be used, and we simply modified the listening TCP port number to match our DNP3 session, in this case 20000.

Serial : Terminal Server : Channel Settings

Add New Channel

Port ID	Call Direction	Session Type	Priority (DiffServ)	Payload Offset	Local IP	Local TCP	Remote Name or IP	Remote TCP	Maximum Connections	Retry Time (secs)
S1	In	Raw	Default	Yes	Any	0		0	5	30

Reset Settings Apply Settings

Existing Channels

Port ID	Call Direction	Session Type	Priority (DiffServ)	Payload Offset	Local IP	Local TCP	Remote Name or IP	Remote TCP	Maximum Connections	Retry Time (secs)	Delete
S1	In	Raw	Default	Yes	Any	20000		0	5	30	<input type="checkbox"/>
S2	In	Raw	Default	Yes	Any	10202		0	5	30	<input type="checkbox"/>
S3	In	Raw	Default	Yes	Any	10203		0	5	30	<input type="checkbox"/>
S4	In	Raw	Default	Yes	Any	10204		0	5	30	<input type="checkbox"/>

Saving Configurations

Please make sure you SAVE the configurations we have made by hitting the "SAVE" ICON at the bottom right of the WEB screen, the button is highlighted when there are configurations that have not been saved.

SCADA Host Connection

So to make the SCADA Host connect we simply launch a DNP3 TCP session to the WAN IP port address of the DX940e using the port number "20000". So in this case TCP 10.10.10.2 port 20000.

We can check the connection by looking here at the channel status of the Terminal Server/Serial port

Serial : Terminal Server : Connections

Port ID	Connection Type	Session Type	Local IP	Local TCP	Remote Name or IP	Remote TCP	Tx Octets	Rx Octets	Delete
S1	TCP	Raw	10.10.10.2	20000	192.168.2.1	54882	142	142	<input type="checkbox"/>

Saving Configurations
